

Intruder Alarm Systems – Residential Wireless

In order to deter intruders and anti-social behaviour at our homes we must firstly study the street view of the property and work to make it a less appealing and more difficult a target. Practical measures to achieve this aim include opening up outside spaces to remove hidden areas, physical items such as locks / doors / windows, security lighting, alarm systems and CCTV. The Visual Deterrent Factor of these measures is important and is particularly affected by the professional appearance of any measures taken

ITS intruder alarm systems are built from a range of carefully selected products to provide a building wide detection system. The wireless range includes many different products to cover all types of environment and to ensure long term reliability. Prior to installation we will carry out a wireless signal strength survey to ensure suitability.

Wireless systems offer the advantage of **much reduced disruption** as very little wiring needs to be installed other than a mains supply to the control panel. Choosing the correct equipment is essential as not all systems really meet the requirement to give long term reliability we require but we evaluate all our products in depth before offering them to ensure full peace of mind. Beware some lo-cost systems on the market as they are unlikely to give trouble free operation: allow us to help you chose proven and reliable technology.
